

1. Download and open [Github Desktop](#).

You should see a screen like this:

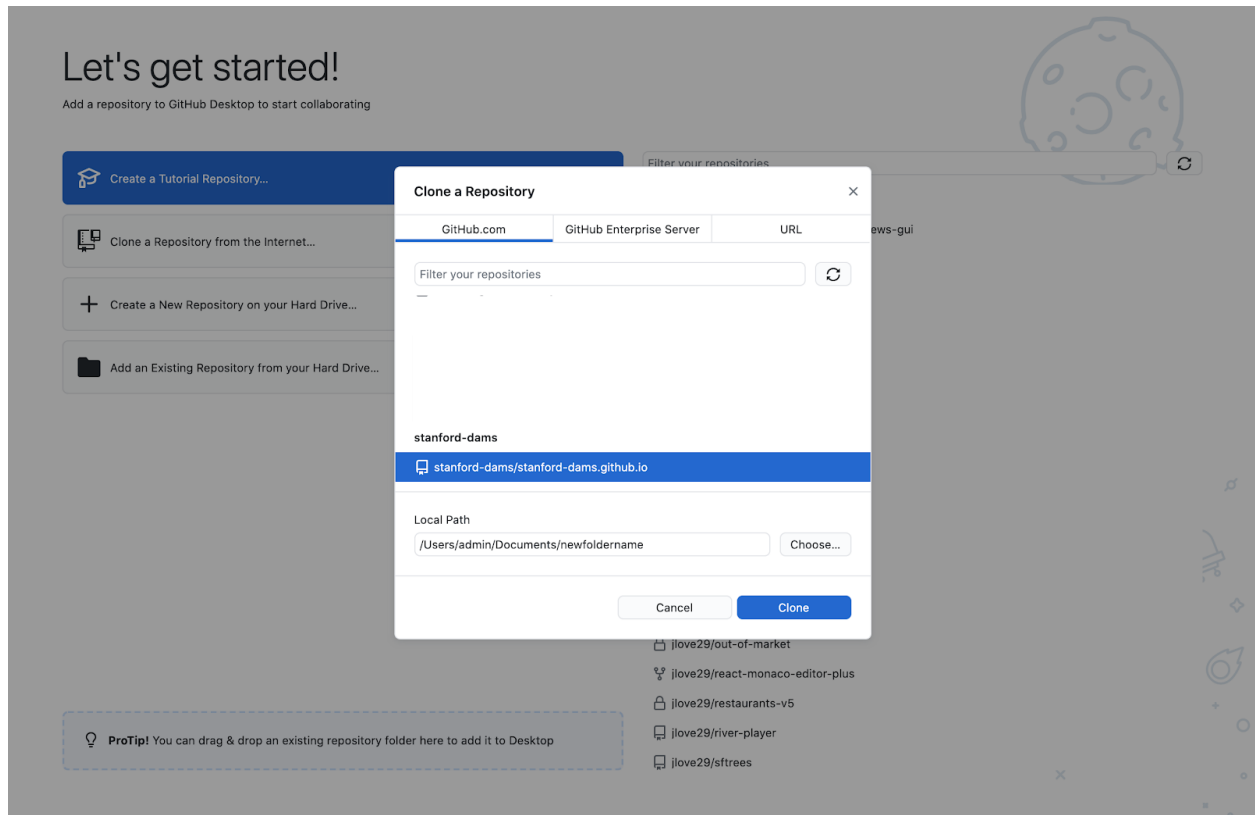

Let's get started!

Add a repository to GitHub Desktop to start collaborating

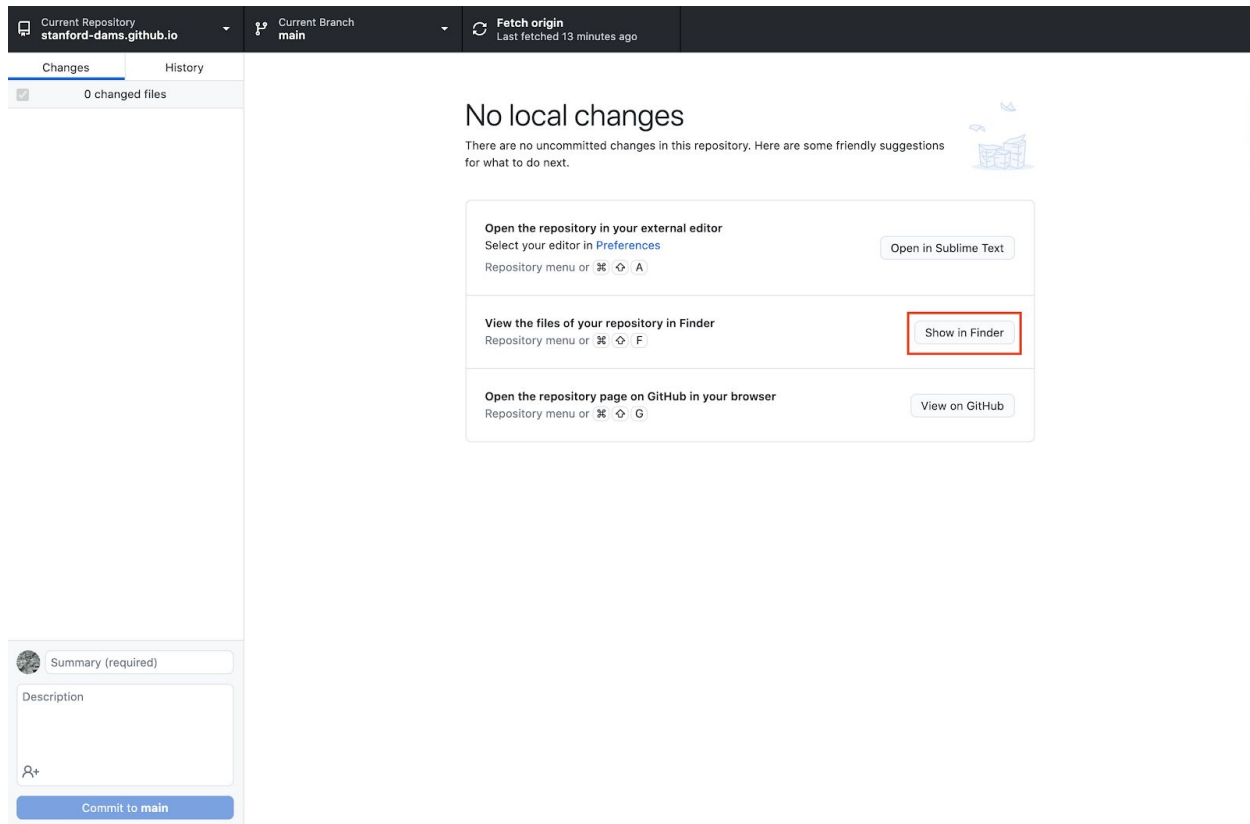

2. Clone the repository.

- In Github Desktop, select **Clone a Repository from the Internet**.
- In the window titled **GitHub.com**, find and select **stanford-dams/stanford-dams.github.io**.
- Under **Local Path**, specify the path to a new folder where you want to store the code. For example, if I wanted to save the files to a new folder called **collisions-map** in my Documents folder, I would type **/Users/juliette/Documents/collisions-map** in the **Local Path** field.
- Select **Clone**.

3. Update the **collisions-cleaned.csv** data file.

- You should see a window that looks like this once you've cloned the repository.
- Select **Show in Finder**. This will open a Finder window where you have stored the code.

- In the **stanford-dams.github.io** folder, navigate to the **tamc** folder and drag in a new **Collisions.csv** file.
- Run the **CleanedMontereyData.R** script. This will generate a new **collisions_final_cleaned.csv** file.

4. Update the web map.

- Navigate back to Github Desktop. You should now see that some files have been changed.
- On the bottom left, select **Commit to main**.
- At the top, click **Push origin**.
- After a few minutes, you should see that the map has been updated online.
